Steering wheel & boss kit Fitting Instructions:

Congratulations on the Purchase of a SAAS Boss Kit, whilst the installation is relatively simple it's very important that you follow the fitting instructions step by step in order so it is fitted correctly.

1. Before removing your original steering wheel make sure the front wheels of your car are in a straight position. It is important that these are aligned straight; otherwise your new wheel may be fitted out of line.
2. To remove the original steering wheel horn cover please refer back to the original workshop manual on how this should be carried out so you have access to the nut on the shaft.
3. Once you have taken the horn cover off as per your workshop manual and you have access to the nut, loosen the nut until the nut is flush with the end of the shaft making sure not to completely remove it.
4. To remove the steering wheel a wheel puller will be required (never use a hammer to force off)
5. Now that the steering wheel is removed and you're left with the spline double check to see the wheels have not moved during the removal of the wheel.
6. The Boss Kit has a top mark (an upside down V which is between 3 screw holes) which is an indicator that represents that this is the top and the wheel.
- **Please note:** some cars horn contacts need to be removed from the original steering wheel and place on the bottom of the new boss kit such cars are; Old Holden's (Premier, Kingswood etc.) Commodores (VB – VL etc.) and some others.
7. Bolt the steering wheel to the boss kit and slide it onto the shaft. Once it gets tight, tighten the nut so it makes a good contact with the taper on the shaft Taking into account not to over tighten it.
8. Drive the car very carefully over 100 meters driving slowly, This is enough to determine whether or not the steering wheel is straight and in line.
9. After the road test retighten the nut according to the cars specifications normal setting.(this is very important and all care and responsibility should be taken if unsure consult a professional)
10. To Connect A horn button this may require 1 of the 2 process below:
 - 1st Process - If no horn dress ring is supplied with the wheel hook up the wires to the horn button and push into position. Press to see if horn works if not reverse the wires on the button.
 - 2nd Process – If there is a dress ring you will have to remove the steering wheel from the boss kit. Next step is to carefully hook up the wires to the horn button, another set of hands may be required to help do this so when your attaching the dress ring over the horn button and placing it on top of the wheel this is so you can screw in the Allen keys to the boss kit

IMPORTANT: If you have to remove a SAAS Aftermarket Steering Wheel from your Vehicle, ensure to use a suitable steering wheel puller (do not use two hands to pull off the wheel). Failing to do this may result in Damage to the Wheel (Especially for Wooden Steering Wheels), THIS WILL VOID YOUR GUARANTEE.
